

# Analysis of planar truss structure

We want to compute the displacement at nodes of the following truss structure

The numerical values for this example are the following:

- $L = 1$  [m];
- Cross section for beam 1:  $A_1 = \sqrt{2}A$  where  $A = 4 \cdot 10^{-4}$  [m<sup>2</sup>];
- Cross section for beam 2:  $A_2 = A$ ;
- Young Modulus (for both beams)  $E = 210$  [GPa];
- From the geometry  $\theta = \pi/4$ ;
- Applied force  $F = 50$  kN.
